## Summary:

The PSG was good for showing all the parts of speech for the sentence. It was pretty detailed in what parts of speech it gave each word, and there was a hierarchy that formed which showed the clauses of the sentence. The con for the PSG was that it produced a pretty complex graph, which didn't show much semantic meaning for the sentence or relationships among words. The Dependency graph was good because it showed more about how the words related to each other in forming the sentence. The dependency graph also showed parts of speech which was nice. The lack of a hierarchical order is a con for the dependency graph that gives the PSG an advantage. There is also a lack of semantic meaning shown for the sentence. SRL parse is good because it shows semantic meaning between the verbs and subjects in the sentence. It is pretty high level though and lacks the detailed hierarchy of the PSG and the relations that the dependency graph shows.
